

Integrated Path Differential Absorption Lidar Optimizations Based on Pre-analyzed Atmospheric Data for ASCENDS Mission Applications

Denis Pliutau, Narasimha S. Prasad (narasimha.s.prasad@nasa.gov)
NASA Langley Research Center, Hampton, VA

Satellite trace gas sensing modeling for missions such as ASCENDS

- Simulation framework to predict performance of trace gas sensing in the atmosphere from space
- Spectroscopic (excitation wavelengths optimizations) and lidar analysis
- Applicable to active sensing missions such as ASCENDS and a variety of molecules including CO₂, CH₄, N₂O etc.
- Projected open source distribution

ASCENDS mission overview

Requirements and approach

- ASCENDS is identified as a medium size Tier II NASA mission in the NRC Decadal Survey and is currently slated for 2019 launch
- ASCENDS will deliver laser based remote sensing measurements of Global CO₂ mixing ratios
- (XCO₂) to a precision of **0.3 percent** on horizontal scales of 100-km over land and 200-km over oceans and passive CO measurements for CO₂ interpretation.
- ASCENDS is the logical extension of OCO and GOSAT

Benefits for climate science

- Quantify global spatial distribution of atmospheric CO₂ on scales of weather models
- Quantify global spatial distribution of terrestrial and oceanic sources and sinks of CO₂ during day/night over all seasons.
- Provide a scientific basis for future projections of CO₂ sources and sinks through data-driven enhancements of Earth-system process modeling.

NASA LaRC ASCENDS approach

- < 0.3% accuracy (~1ppm) in CO₂ mixing ratio resolution is required NASA Langley Research Center (LaRC) is developing an **intensity modulated continuous wave (IMCW) laser absorption spectrometer** based remote sensing scheme for the detection of CO₂ at 1.57 microns and O₂ at 1.26 microns from space based platforms
- Multiple wavelengths with differential absorption (DIAL) technique are used 1.26 micron band for O₂ sensing is selected to obtain surface pressure
- 1.26 micron band provides architectural and spectroscopic advantages
- For our experiments two candidate wavelengths in this band will be utilized. Nominally, wavelengths around 1.262 and 1.271 microns have been identified in initial tests lines in these two sub-bands are being further analyzed for sensitivity to environmental parameters

Modeling framework for integrated path space lidar performance estimates

Fig 1.1 Previously under development

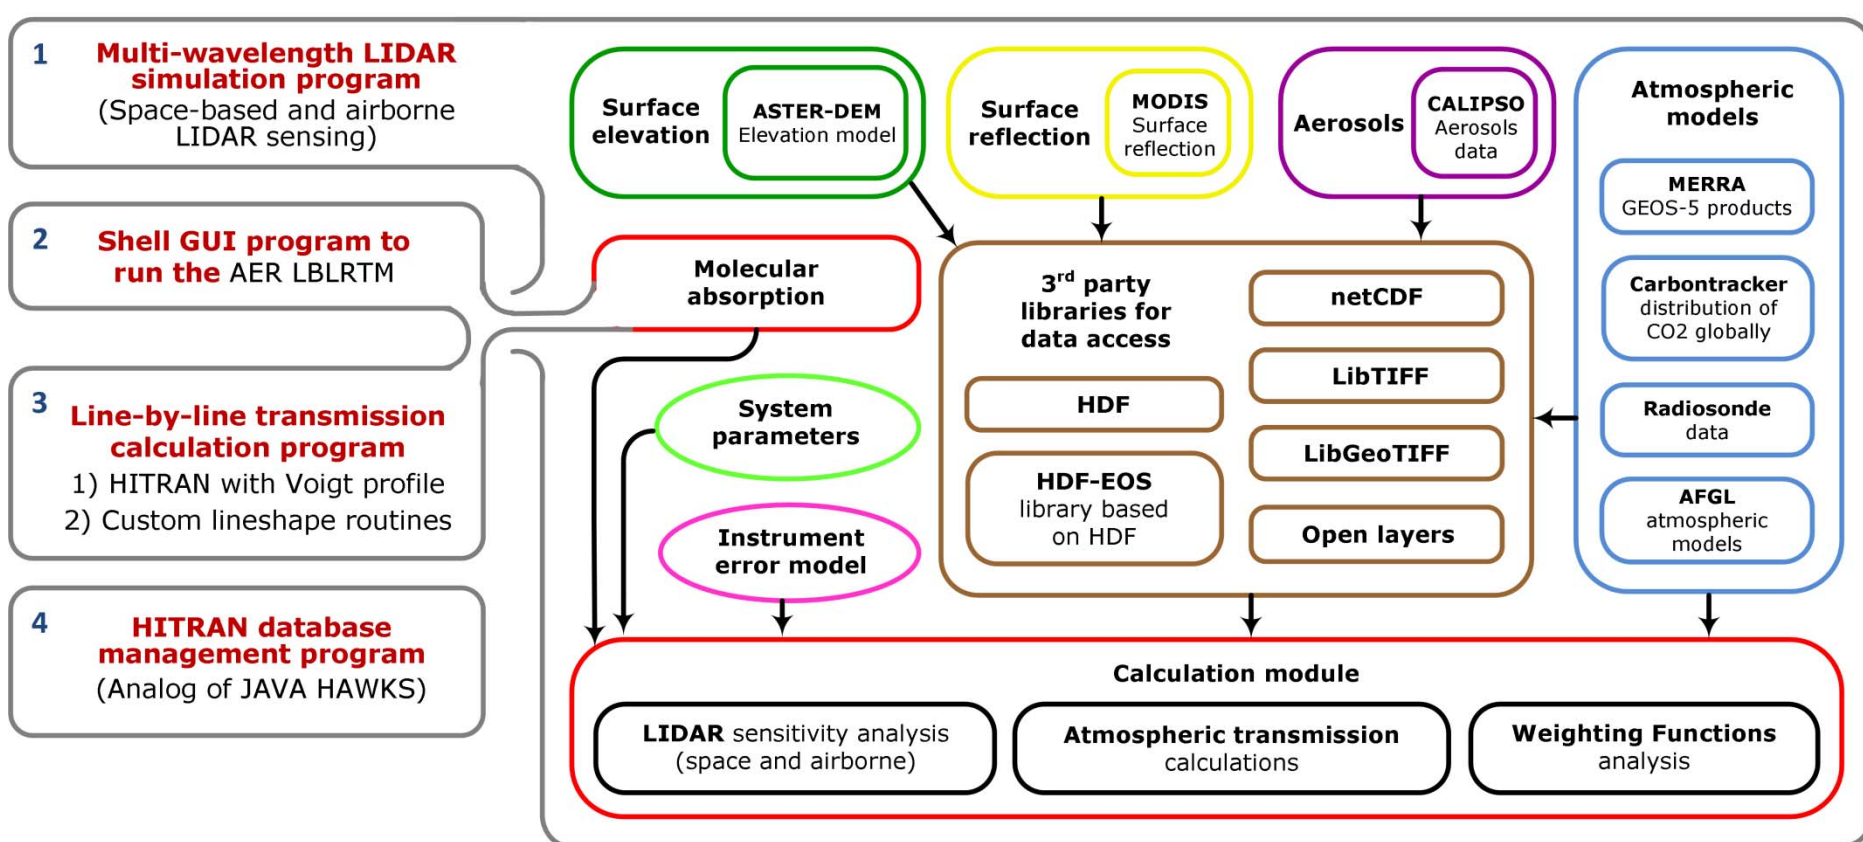

Fig 1.2 New additions

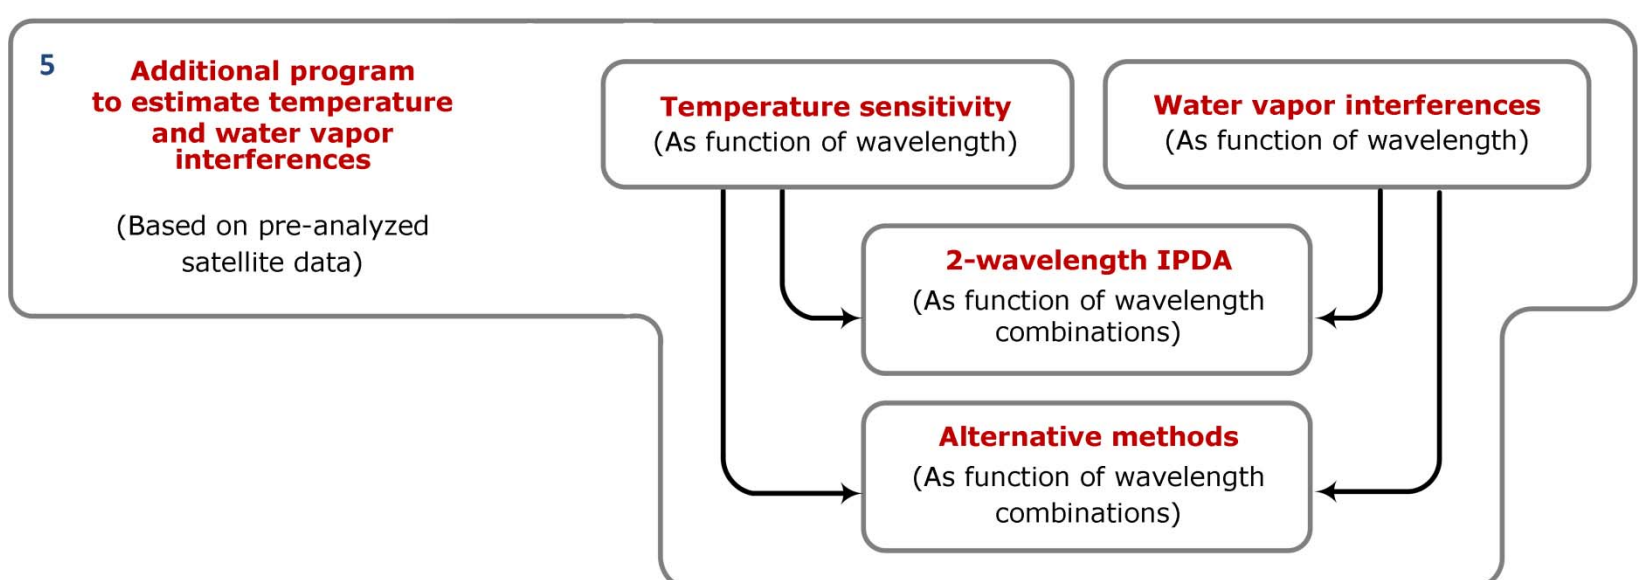

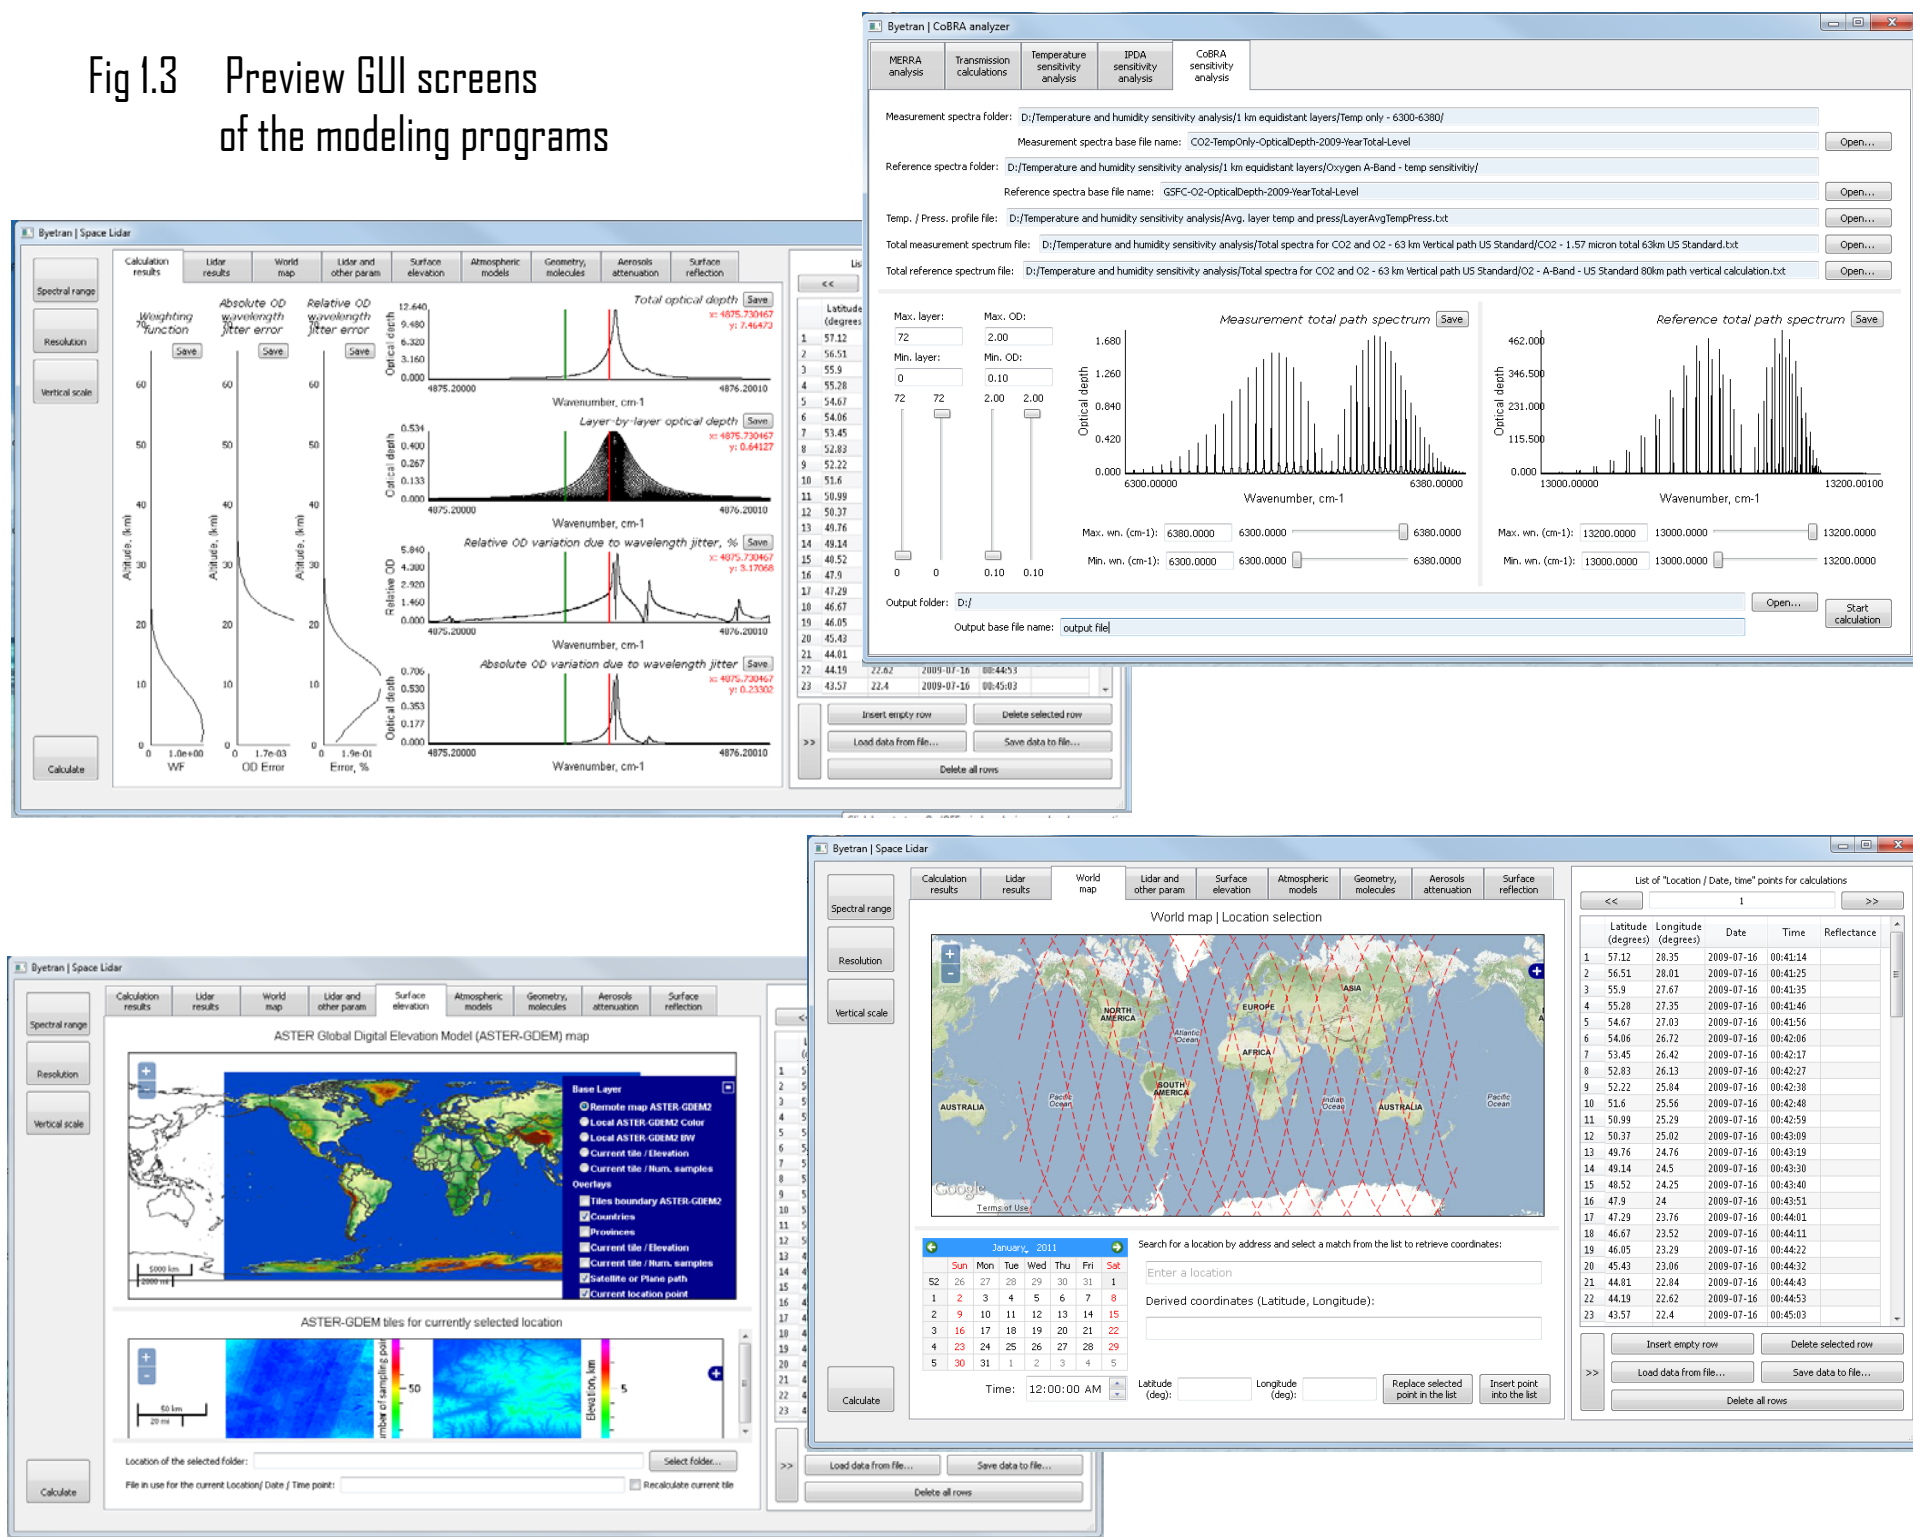

Fig 1.3 Preview GUI screens of the modeling programs

Pre-analyzed atmospheric data for error analysis

Analysis and processing of the MERRA dataset

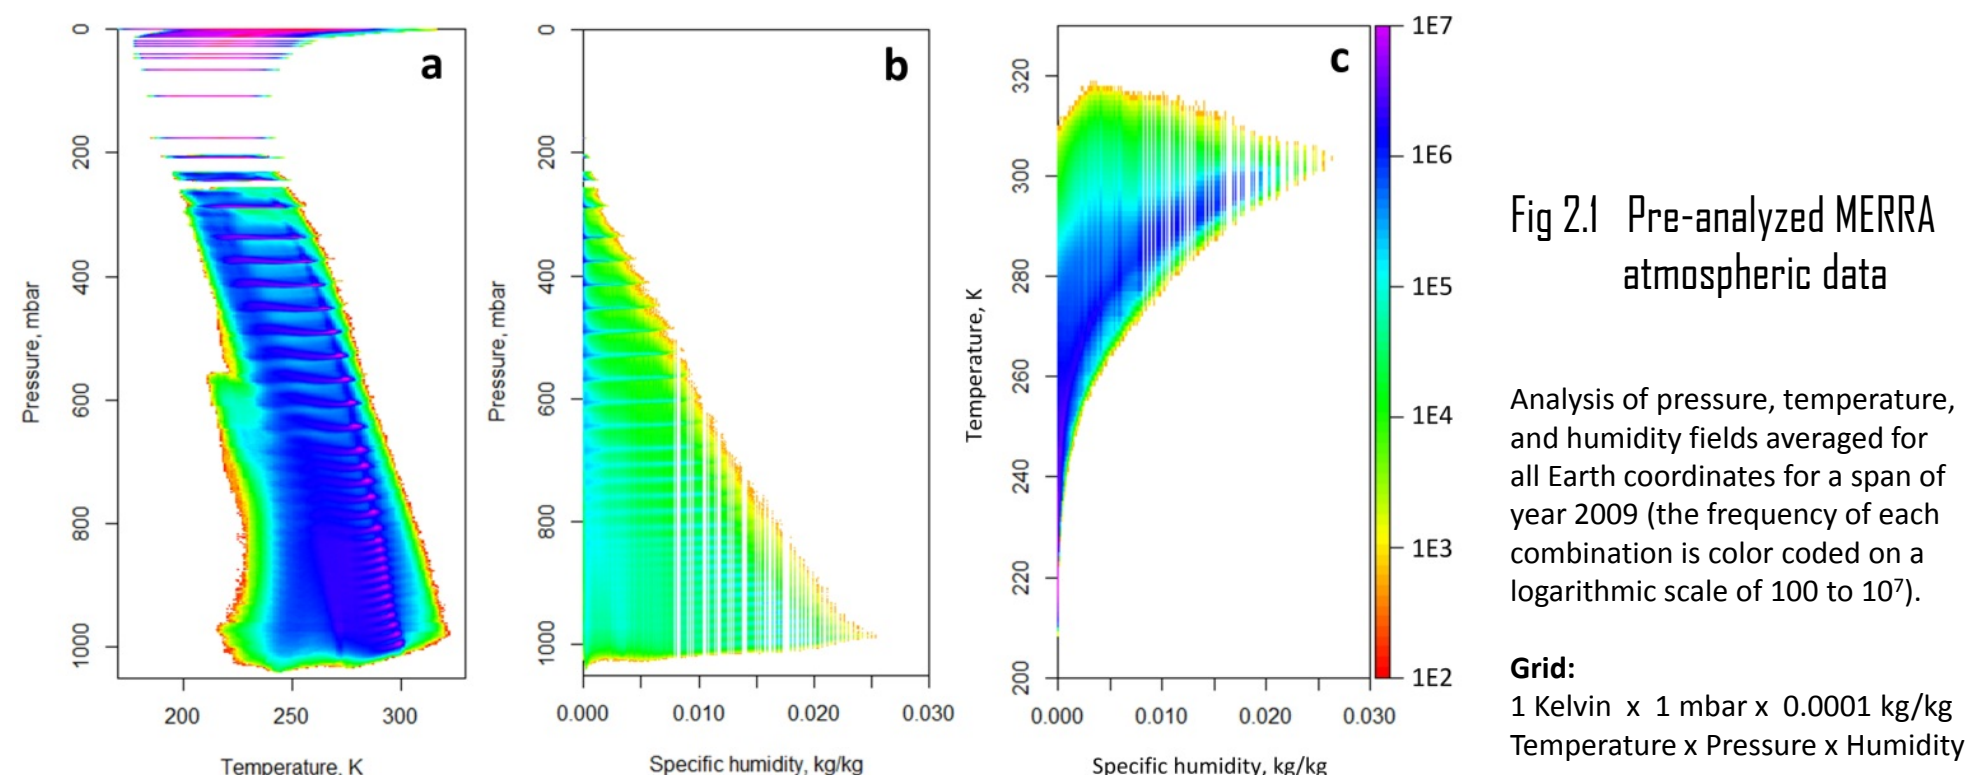

Fig 2.1 Pre-analyzed MERRA atmospheric data

Analysis of pressure, temperature, and humidity fields averaged for all Earth coordinates for a span of year 2009 (the frequency of each combination is color coded on a logarithmic scale of 100 to 10⁷).

Grid:
1 Kelvin x 1 mbar x 0.0001 kg/kg
Temperature x Pressure x Humidity

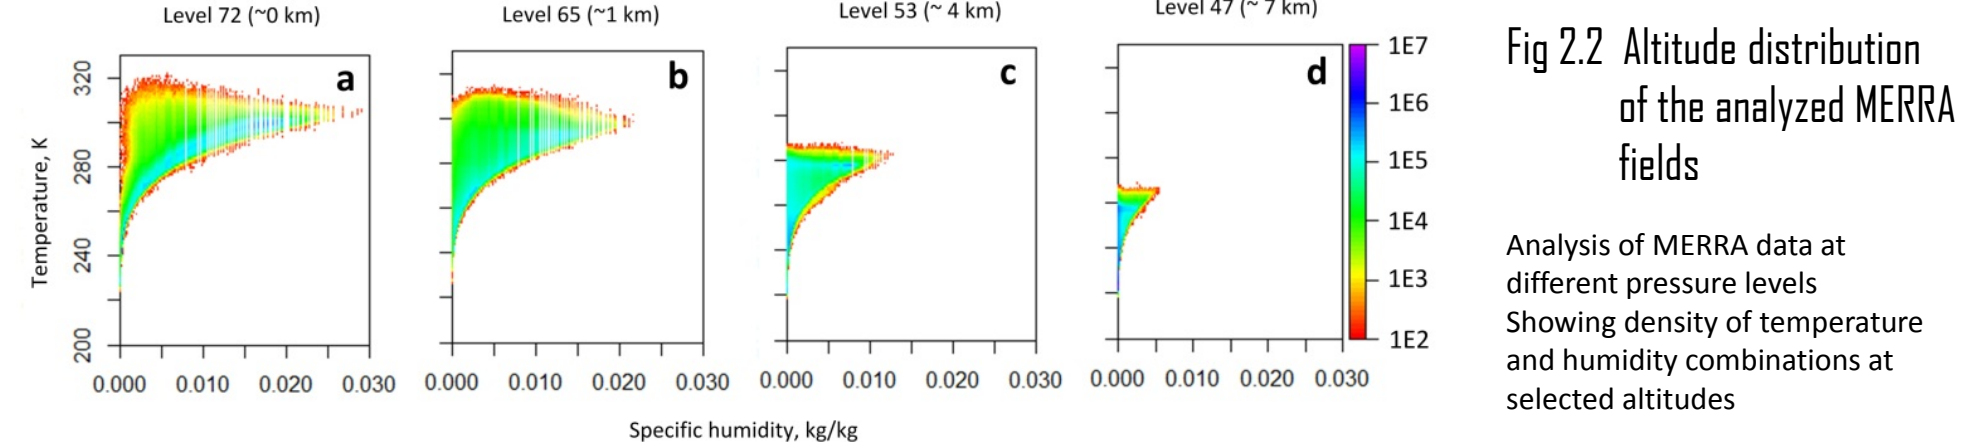

Fig 2.2 Altitude distribution of the analyzed MERRA fields

Analysis of MERRA data at different pressure levels. Showing density of temperature and humidity combinations at selected altitudes

Annual MERRA data for all locations is analyzed to establish the density of points within each temperature x Pressure x Humidity grid bin

Combining individual layer error estimates

Fig 2.3 Averaged temperature and pressure profiles

MERRA atmospheric parameters of pressure and temperature as a function of layer number for the analyzed fields on model layers (inst6_3d_ana_Nv) dataset; (a) - Center positions of the total pressure levels as a function of layer number; (b) Annual average of the temperature values for year pressure level as a function of layer number.

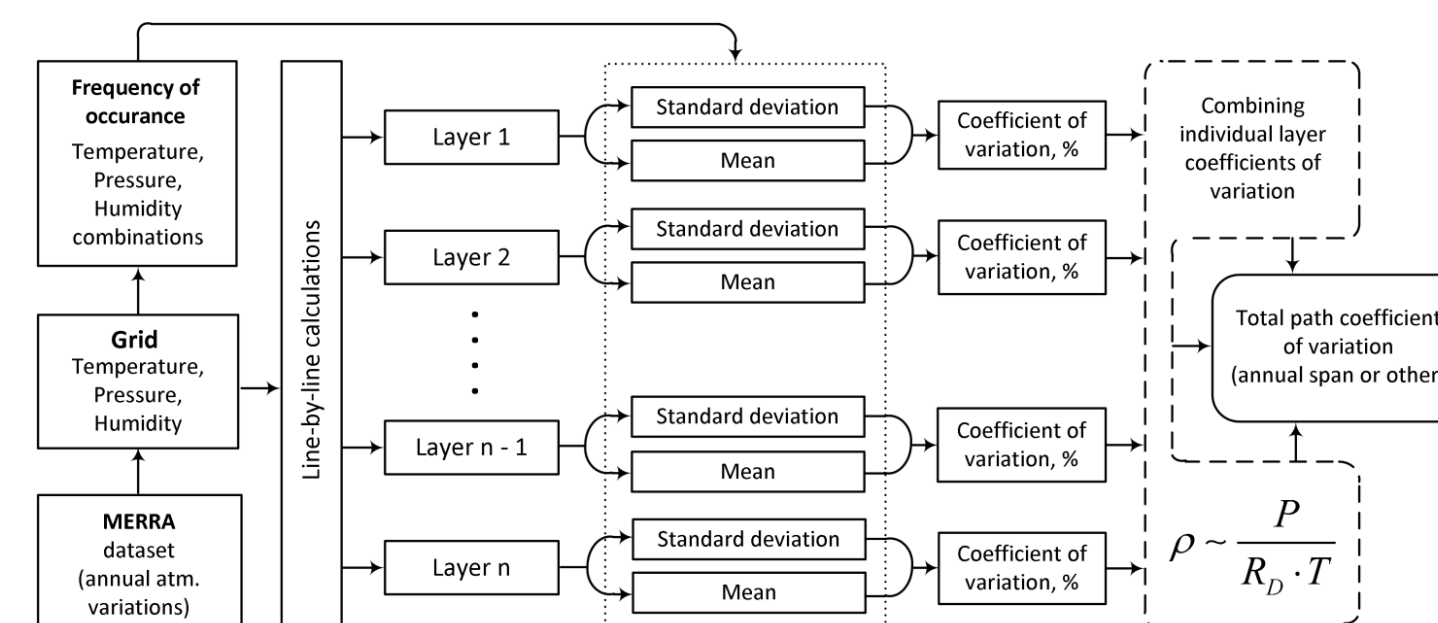

Fig 2.4 Individual layer and combined total path analysis approach

Overview of separate layers analysis methodology based on pre-analyzed MERRA atmospheric fields.

Analyzed MERRA grid data is used in line-by-line calculations for each layer to get coefficients of variation in each layer. Such individual layer coefficients of variation are scaled with layer molecular density and added together to get the total path relative uncertainty.

Global annual temperature sensitivity analysis for CO₂ and O₂ bands

Global annual temperature sensitivity for alternative CO₂ bands

Fig 3.1 Temperature sensitivity analysis for the 1.57 micron CO₂ band

Total absorption spectrum (a) and the temperature induced error (b) for the 1.57 µm band of CO₂ due to annual variations in atmospheric temperature for year 2009.

Fig 3.2 Temperature sensitivity analysis for the 2.05 micron CO₂ band

Total absorption spectrum (a) and the temperature induced error (b) for the 2.05 µm band of CO₂ due to annual variations in atmospheric temperature for year 2009.

Preliminary annual cumulative error due to annual global temperature variations

Global annual temperature sensitivity for alternative O₂ bands

Fig 3.3 Temperature sensitivity analysis for the O₂ A-band

Total absorption spectrum (a) and the temperature induced error (b) for the A-Band of O₂ due to annual variations in atmospheric temperature for year 2009.

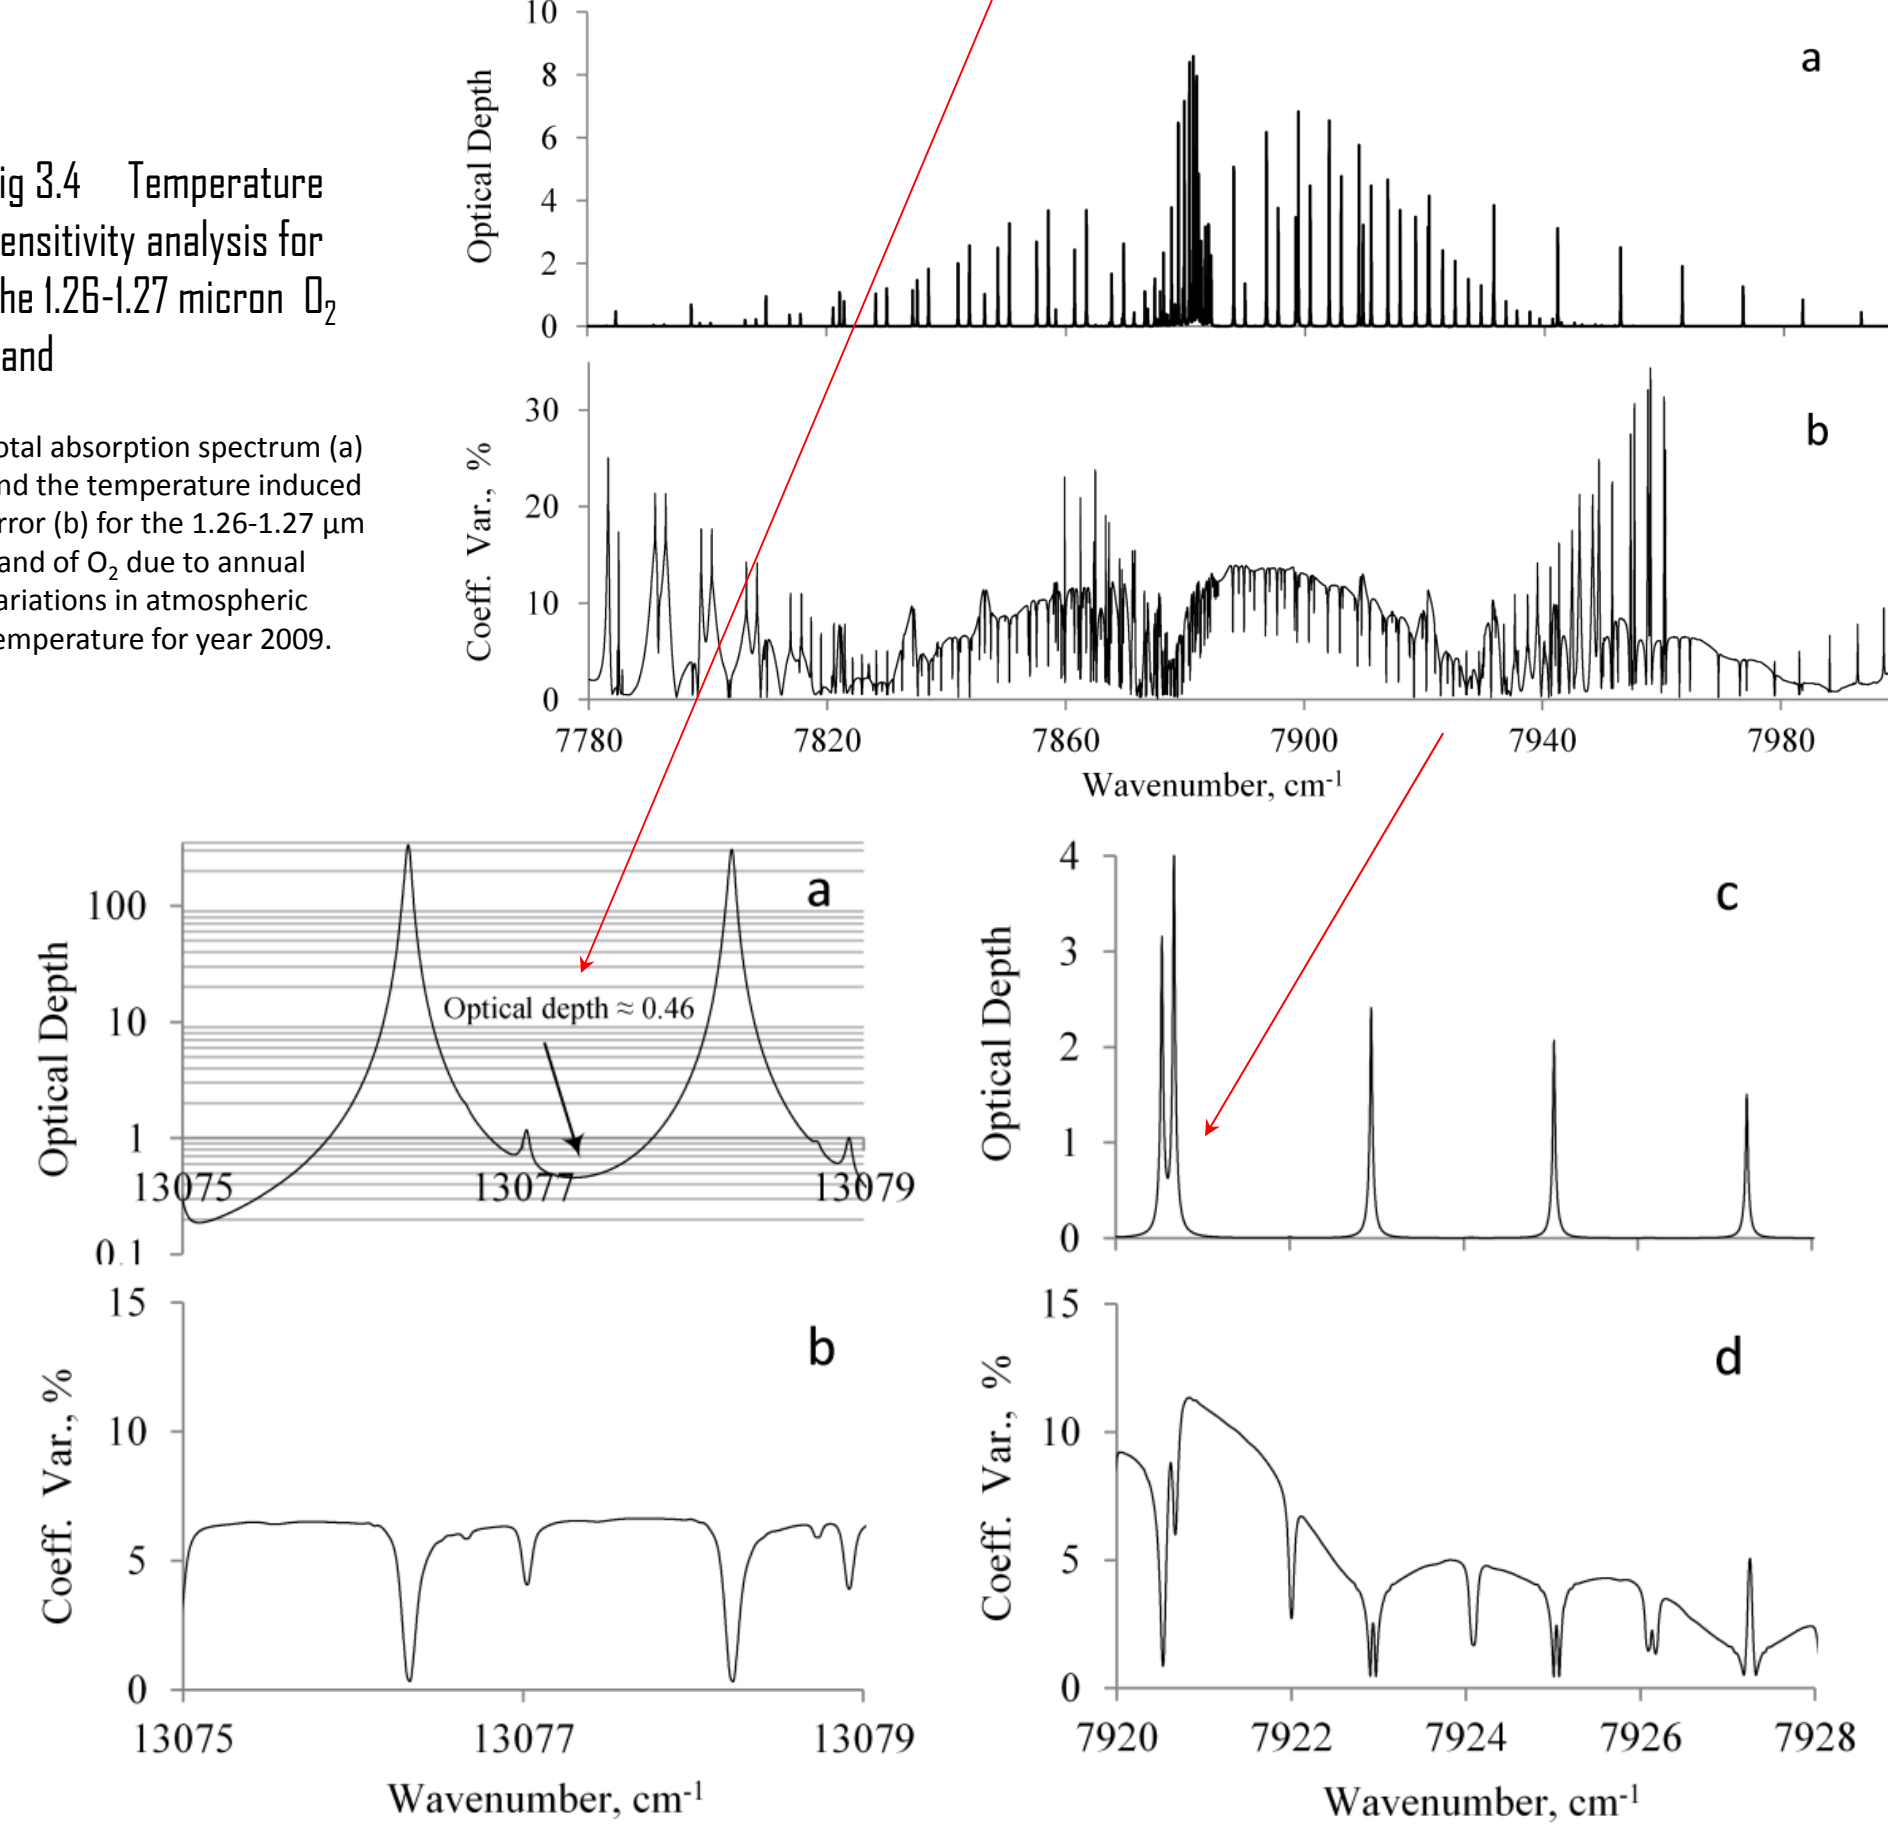

Fig 3.4 Temperature sensitivity analysis for The 1.26-1.27 micron O₂ band

Total absorption spectrum (a) and the temperature induced error (b) for the 1.26-1.27 µm band of O₂ due to annual variations in atmospheric temperature for year 2009.

Temperature sensitivity is comparable for the A-Band and 1.26-1.27 micron O₂ bands. The 1.26-1.27 micron band allows achieving lower temperature sensitivities due to closer proximity to line centers.

Wavelength instability effects

Fig 4.1 Laser wavelength jitter analysis example for selected CO₂ spectral lines

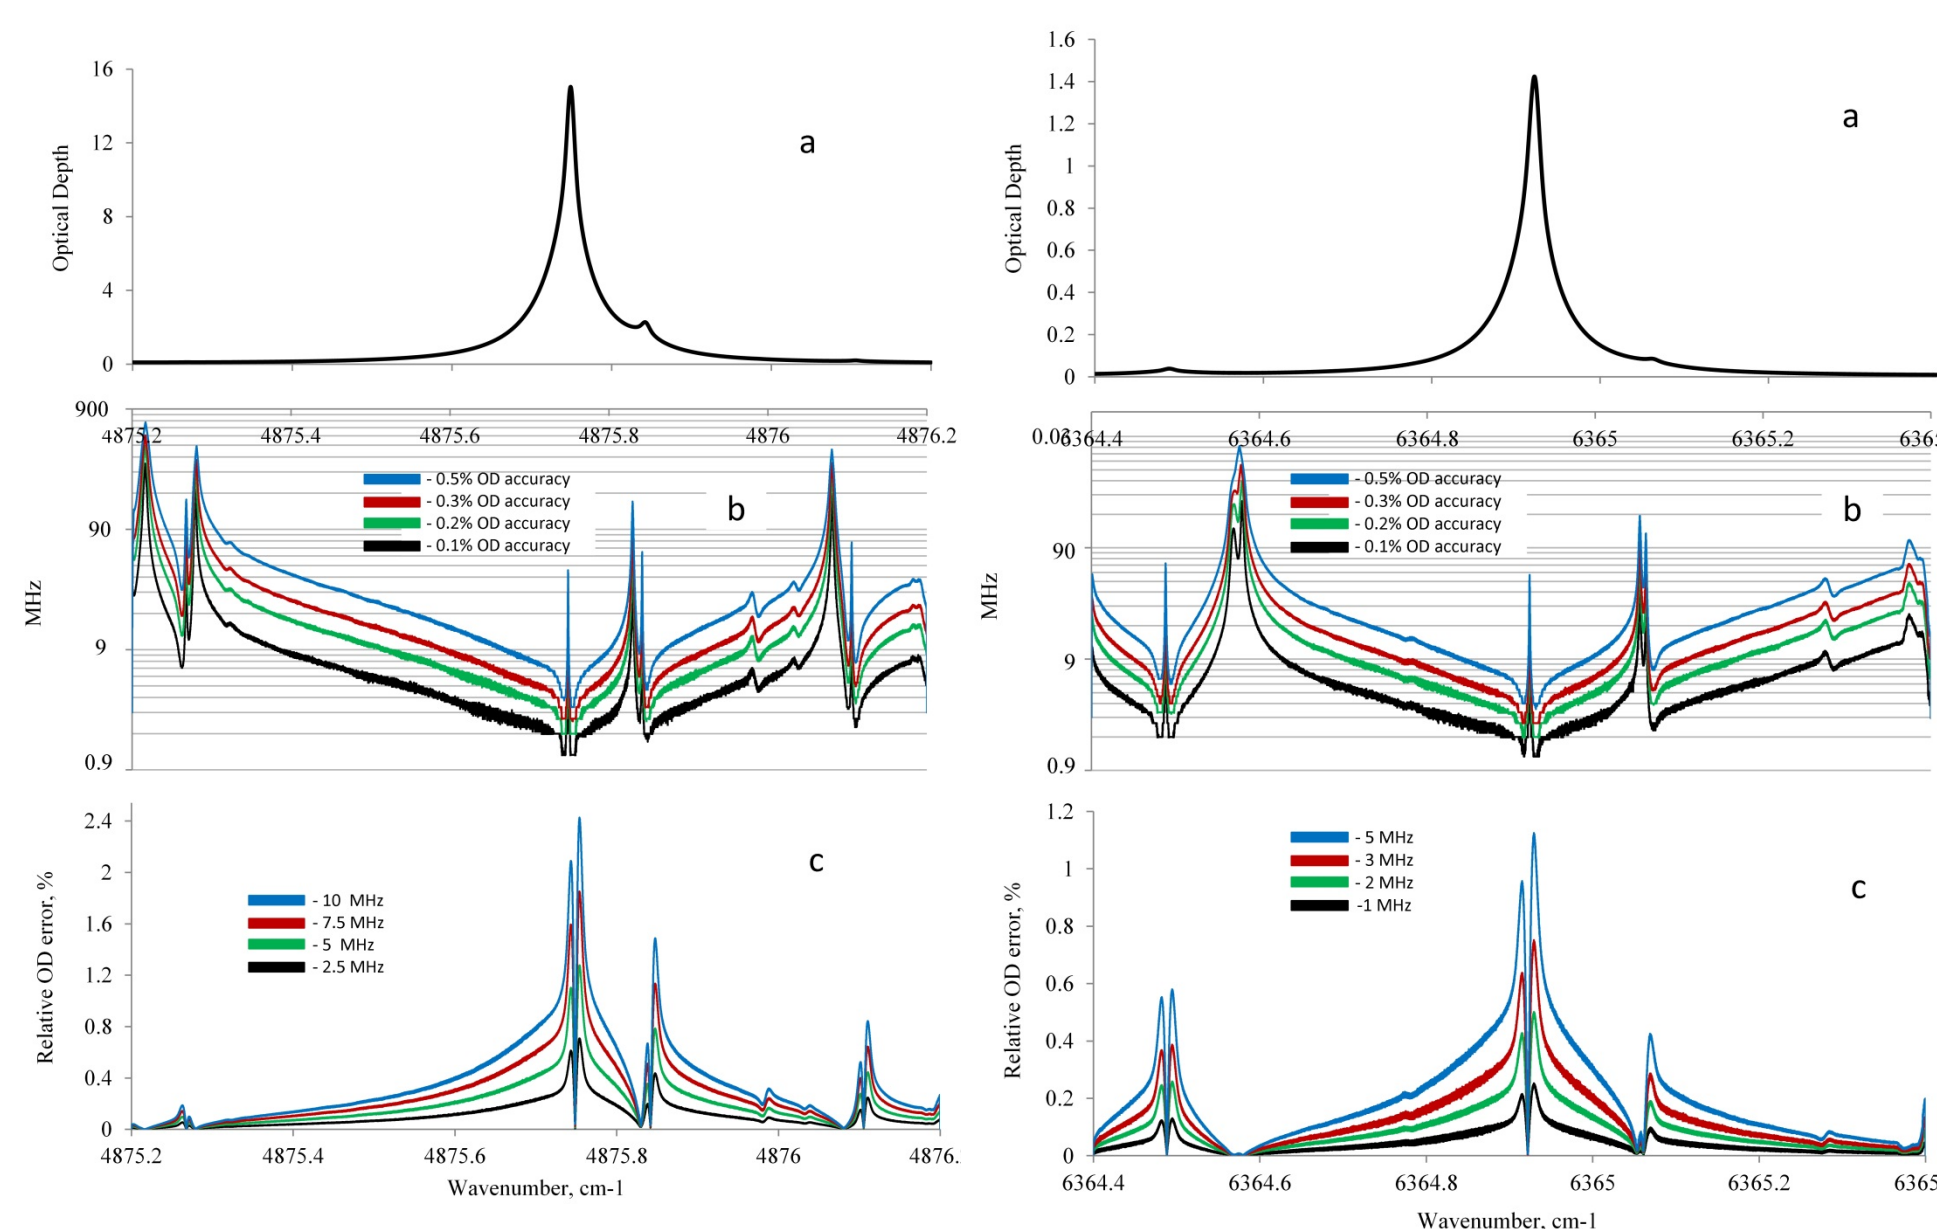

Fig 4.2 Laser wavelength jitter analysis example for selected O₂ spectral lines

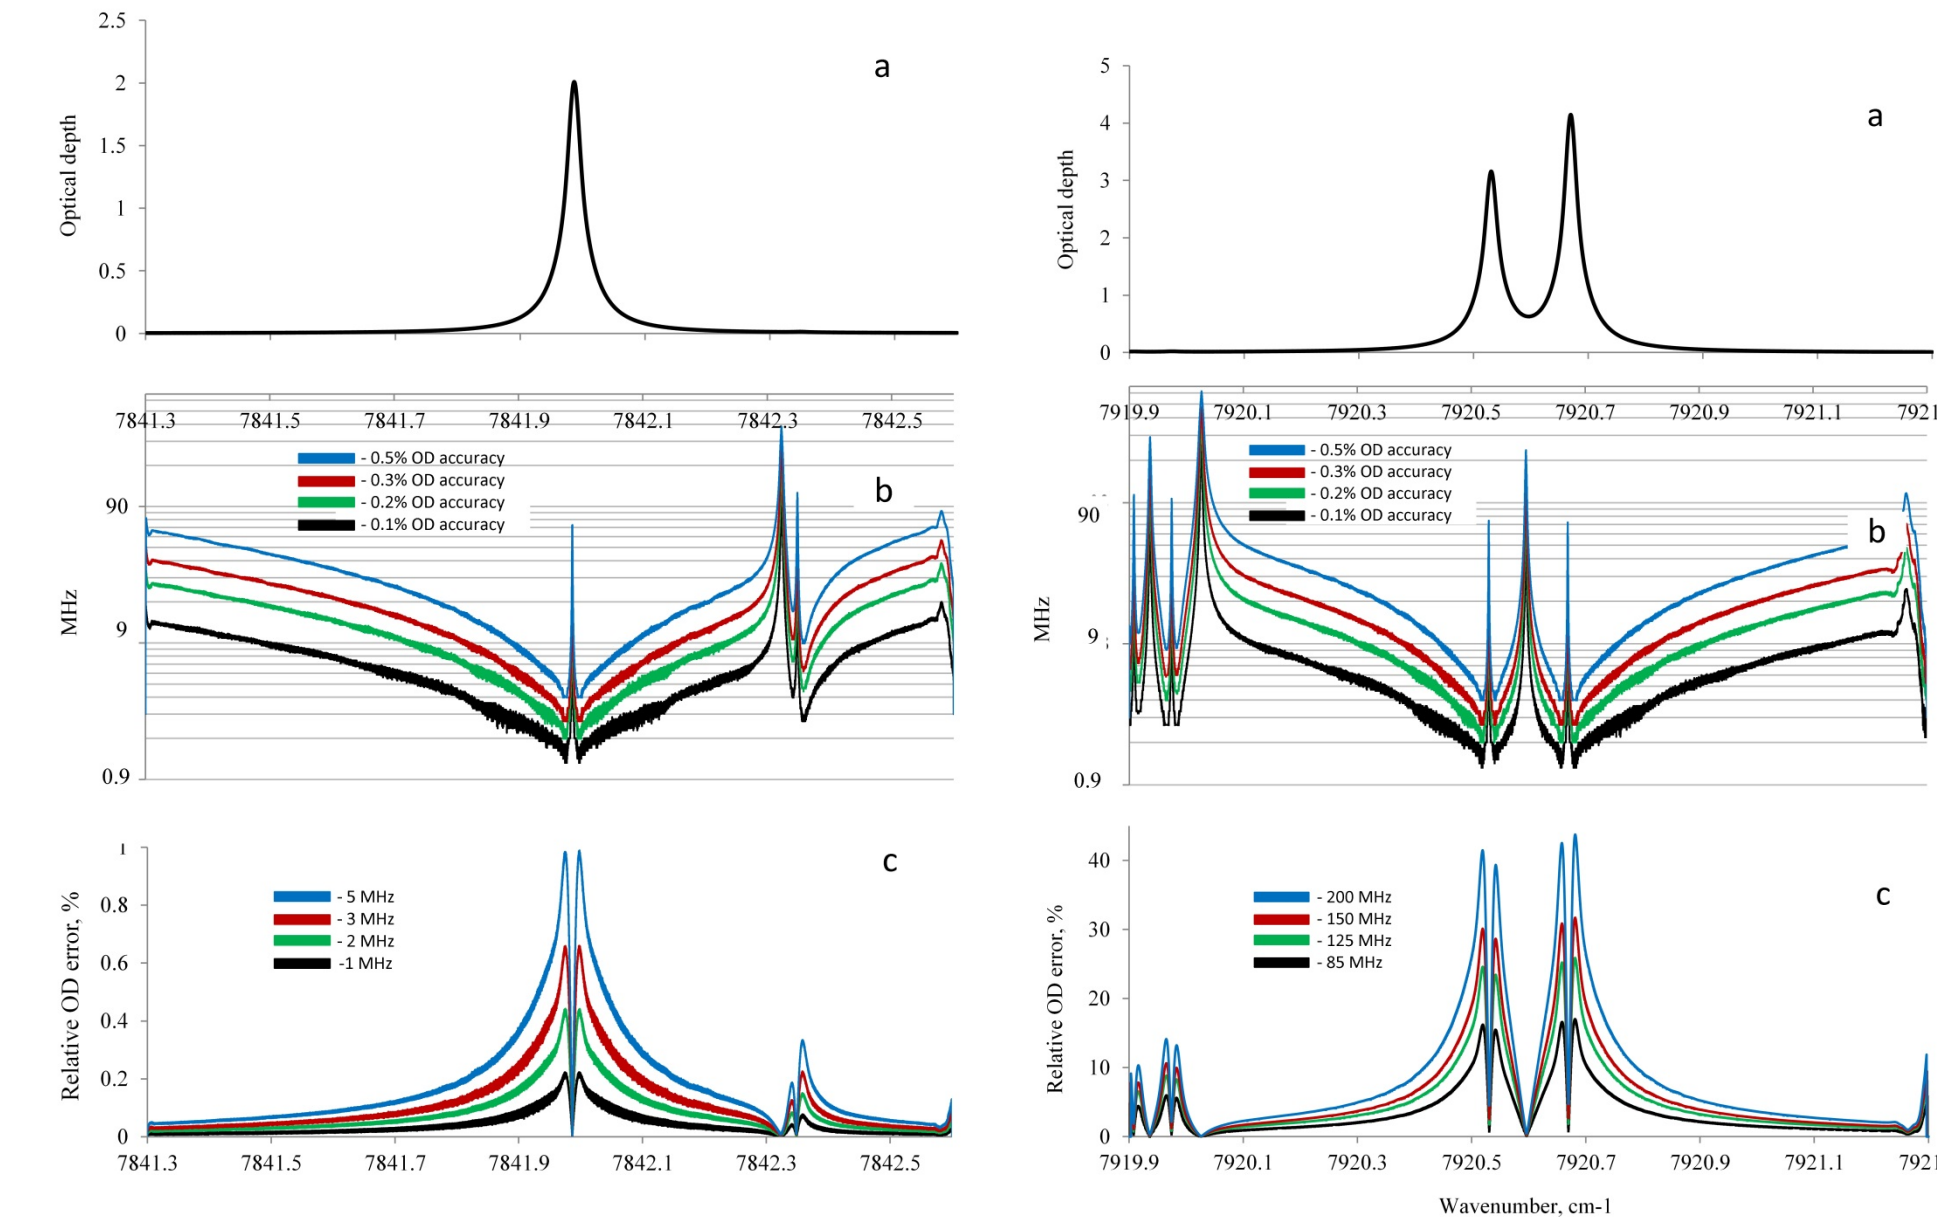

Table 1 Laser wavelength stability requirements in different spectral regions of CO₂ and O₂ molecules to achieve an accuracy of 0.21% in relative optical depth accuracy

Molecule	Center investigating the band	Ref.	Possible lines and wavelengths		Approximate Maximum optical depth	Maximum total jitter for < 0.21% optical depth accuracy		
			Wavenumber, cm ⁻¹	Wavelength, nm		MHz	pm	cm ⁻¹
O ₂	GSFC	1, 2	13075.819	764.7705	0.87	16	0.031	0.00053
O ₂	GSFC	1, 2	13075.944	764.7631	1.47	11	0.022	0.00037
O ₂	GSFC	1, 2	13076.064	764.7561	3.15	8	0.016	0.00027
O ₂	GSFC	1, 2	13077.297	764.684	0.46	1400	2.73	0.047
O ₂	LaRC	2	7841.9866 line	1275.1871	1.95 peak	1	0.054	0.000033
O ₂	LaRC	2	7920.596	1262.5312	~ 0.68	130	0.69	0.0043
CO ₂	GSFC	2	6359.9674 line	1572.335	~ 1.9 peak	1	0.0082	0.000033
CO ₂	LaRC	2	6364.922 line	1571.111	~ 1.38 peak	1	0.0082	0.000033
CO ₂	JPL	additional example	4875.6905	2050.992	2.6	2	0.028	0.000067
CO ₂	JPL	3	4875.6265	2051.018	0.9	4	0.056	0.00013
CO ₂	JPL	4	4875.5882	2050.911	0.89	4	0.056	0.00013

Notes: Wavelength positions are approximate based on the data previously reported. The values are presented for specific frequencies or entire lines (marked as "line"). Intensities are specified for either exact wavelength positions or peaks of the lines. The laser jitter is specified for the total wavelength variation span of the laser wavelength.

Conclusions and further work

- Framework applicable to any molecule
- Framework operated in the Beta version, further debugging and improvements are ongoing
- Simulation programs are used for the analysis of temperature sensitivity, wavelength stability effects and the weighting functions calculations
- Further analysis and reduction of water vapor interferences is under investigation
- Alternative measurement approaches are being studied
- Verification of the modeling framework components is planned
- The advantages of the implemented methodology is the reduction in required number of calculations (ordinary PC may be used)
